

A New Smilax L. Species from the Upper Oligocene of Vértezzőlős (Hungary)

by L. HABLY, Budapest & A. CSABA, Dömös

Abstract — *Smilax tataensis* sp. n. is described from the layers of Upper Oligocene in the environs of Vértezzőlős (Baromállás). It is represented by two specimens in the flora; one of them is with counterproof. The new species is near to *Smilax grandifolia* (UNG) HEER. With 8 figures and 1 map.

From the flora association collection from the hill, called Baromállás hegyn between Vértezzőlős and Tatabánya, a new *Smilax* species was discovered (HABLY 1976). The deposits are embedded in clayey sandstone and, are slightly red owing to limonitization.

SMILACACEAE

Smilax tataensis sp. n. (Figs. 1, 7, 8)

Holotypus: No. 76.4.230. In collectione Musei Tataensis nominatio de Kuny Domokos, Hungaria. **Paratypus:** No. 76.4.231., 76.4.232. In collectione Musei Tataensis nominatio de Kuny Domokos, Hungaria.

Locus typicus: Collis Baromállás, regio Tatabánya et Vértezzőlős, Hungaria (Map I). — **Stratum typicum:** Oligocen superior (egerien).

Derivation nominis: Post locum depositionis.

Diagnosis — *Folium sine petiolo, forma eius fere ovata, triangularisve, apice acuto, basi cordata. Longitudo maxima folii quam metiri possumus, 14,5 cm,*

Map 1. Schematic map of the locality of Baromállás-hegy near Vértezzőlős and Tatabánya.

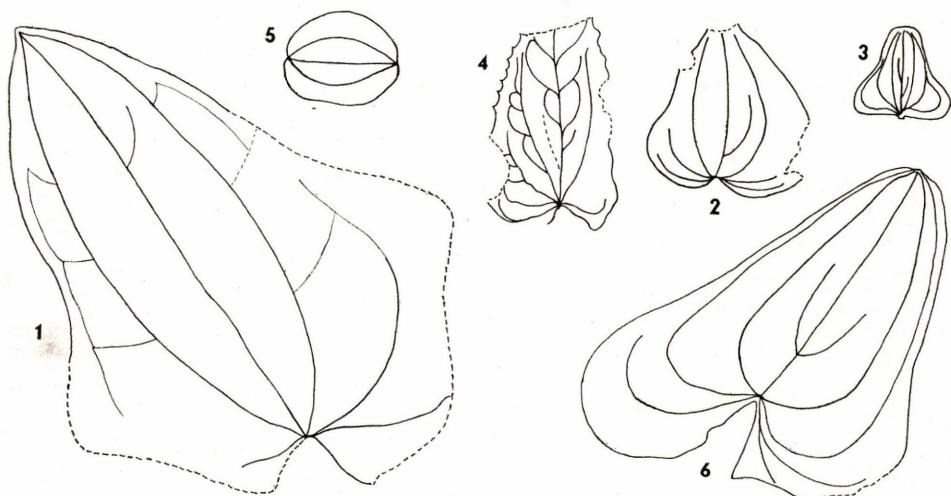

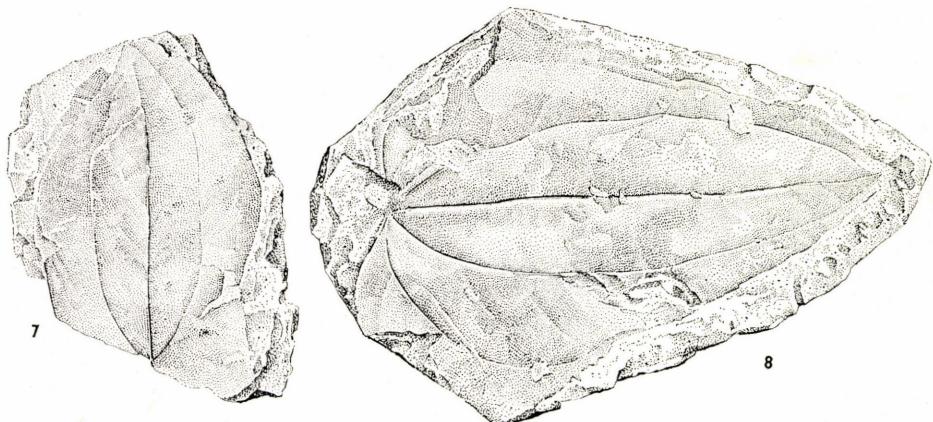

Fig. 1. *Smilax tataensis* sp. n. No. 76.4.230. — Fig. 2. *Smilax grandifolia* (UNG) HEER. — Fig. 3. *Smilax obtusifolia* HEER. — Fig. 4. *Smilax praesaspera* ANDR. — Fig. 5. *Smilax borodense* ANDR. — Fig. 6. *Smilacites grandifolia* UNG.

latitudoque eius maxima 8.3 cm. Folium in parte superiore tertia 6.2 cm latum, margo eius integerrimus. Nervi septemque ex eodem loco oriuntur. Nervus medius recte usque ad apicem decurrit, duo alii utrinque sub angulo 46° gr. arcuato emissi et medio recurvati in apice se conjungunt, ellipsem regularem conformantes. Duo nervi marginales sub angulo 106° gr. excurrunt et secum nervis secundariis ee internis nervis primariis emissis conjungunt. Solum unus nervus secundarius tenuissimus e nervo medio exoriens videri potest.

The species shows most similarity with *Smilax grandifolia* (UNG) HEER (HEER 1855) (Fig. 2.), however, the two primordial veins embrace an ovate form and not a regular ellipsoidal one, and also the length-width ratio differs considerably.

Their shape is not entirely similar either since the narrowing down of the

Figs. 7—8. *Smilax tataensis* sp. n.: 7 = No. 76.4.232., 8 = No. 76.4.230.

upper third of *Smilax grandifolia* (UNG) HEER is not of such a large extent as in *S. tataensis*: *S. grandifolia* of the Tertier has been obtained from several habitats (HEER 1855, STAUB 1864, KNOBLOCH 1958, GIVULESCU 1973). The form of *Smilacites grandifolia* UNG. (UNGER 1847) (Fig. 6) shows a certain similarity to *S. tataensis*, the venation are, however, entirely different. The primordiary veins accompanying the main vein embrace an ovate form, while the further veins run parallel with the margin of the leaf.

As regards *S. obtusifolia* HEER (HEER 1855) (Fig. 3) even its shape is different, since the peak of *S. obtusifolia* is not an acute one, and the venation also shows a considerable difference which feature is the most essential one. In *S. obtusifolia* all the 7 veins take a course towards the apex, the marginal ones near the edge strongly hollow out and run parallel with the border of the leaf.

ANDREANSZKY described two new *Smilax* species from Hungary (ANDREANSZKY 1956, 1959): *S. borsodense* (Fig. 5.) and *S. praeaspera* (Fig. 4.), both considerably differing from *S. tataensis*.

The new species was recovered in two specimens from the flora of Vértezzőlős. The paratype is with a counterproof. The length of the latter is 9.0 cm, its width is 6.2 cm in the upper third of the blade. The course of the right-side vein alongside the main vein is 43°, that of the outer vein is 124/84°. A steeper course is characteristic of the left-side veins.

According to Table 1. *Smilax tataensis* show dissimilarities from the other four species in two exomorphic characters: 10 and 13; and in three quantitative characters: 3, 4 and 5.

As we can seen in the Table 2. common for the every earlier and here described species is the character number 14, therefore it is a generic character up to date. In the character number 1 and 6 four species show similarities, the character numbers 9, 11 and 12 are common in three species, while character numbers 2 and 8 are common only in two species.
